GE DATANET 760 OUTPUT DEVICE

Thomas Knight
9 April 1970

DEVICE 400, physically occupying space in the mag tape control, is a new version of the old Kotok dataphone previously used to interface with the Datanet 760. It sends one start bit, seven bits of data, one of parity and two stop bits at a rate of 2400 baud.

Conditions register:

DATAO 400 sends one seven-bit character, from the right seven bits of the word DATAO 'ed.
